(HEMOPOIETIC SYSTEM—DISEASES)

The role of the neurotropic factor in the etiology, in the progress of the infection, and the outcome of toxic infections of the blood. V. G. Vaynrik. *J. Therap. Arch. (U.S.S.R.)* 15, 848-62 (1937); *Chem. Zentral.* 1939, I, 1507. The subarachnoid injection of hemolytic poisons (PhNH-NH, and Ph) in amts. which would be without effect if introduced intravenously produced definite and characteristic changes in the blood. The effect was specific for the individual poison since the reaction in the blood varies with the poison used. The poisons could not be washed out by subarachnoid injection of physiol. salt soln. Blocking the sympathetic nerve with procaine had a favorable

effect on the course of the hemolytic anemia. These facts indicate that neurotropic factors play a part in the pathogenesis and the course of hemolytic anemia. M. G. M.

Differences in the specificity of the causes of nonspecific pneumonia and pulmonary tuberculosis can be determined from the pathology and clinical course of the two diseases. Process, however, is difficult due to complex nature of the diseases. Observed that the tubercular process is greatly facilitated in those who have had acute pneumonia.

USSR/Medicine - Dispensary Method of medical service

FD - 1922

Card 1/1 Pub 102-3/12

Author : *Vogralik, V. G., Professor

Title : Principal indicators of the status of therapeutic service in Gor'kovskaya oblast

Periodical : Sov. zdrav., 1, 15-20, Jan-Feb, 1955

Abstract : Health officials of the Gor'kovskaya oblast responded readily to the call of party and government USSR for greater efficiency in the field of preventive medicine. They have completed a survey on the causes of various diseases in the oblast, put to use the newest methods of diagnosis and treatment, and improved the dispensary method of medical care. Improvement in dispensary service to urban population began to gain momentum three years ago and in rural areas a little later. Instructions as to the best methods in dispensary service, sent by the Ministry of Health USSR, were received early in 1954, and helped medical officers greatly in their work. The number of physicians in the oblast increased 90% during the period 1951-1954; many positions, particularly in rural areas, are still vacant, however.

"Use of Digital Computers in the Evaluation of Pathogenesis, Diagnosis, and Prognosis of Myocardial Infarction."

CZECHOSLOVAKIA

Prague, Casopis Lekaru Ceskych, Vol 105, No 24-25, 17 Jun 68, pp 683-684

Abstract: Computer evaluation of data obtained in the study of acute infarct of the myocardium is described. 280 indicators were used which allowed the use of 2200 characteristic codes. A 50 page code was prepared. All 280 indicators use numbers 1 to 9, and data on one patient are contained on 4 cards. The first problem is the determination of the frequency of correlation complexes of the most important signs of an acute myocardial infarct.

1253. **Contemporary problems of geriatric surgery** Chirurgie stáří jako současný problém. Vojnout C. and Kolomazník F. Chir. Odd. Ostrava I Rozhl. Chir. 1958, 37/9 (577-584)

A review is given of problems of aging and of organ manifestations of old age in general. On the basis of own experience and of data from the literature, stress is laid on certain fundamental factors in geriatric surgery. Neglect of these factors would indicate an inadequate ability of the surgeon to evaluate correctly the differences in response between old and young subjects to surgical trauma. The authors recommend that this branch of surgery receive greater attention, and are convinced that modern surgery is capable of fulfilling all the special tasks involved in geriatric surgery.

The biochemistry of the synovial fluid of the knee joint.
Cesmru Voigt. *Deutsch. Med. Woch.* 1914, 33, 628-1915.
A study of the synovial fluid of the knee joints obtained
from patients suffering from rheumatism. Analyses and
histological examination of the synovial tissue. The results
are compared with those obtained by other authors in
the case of normal joints. The following substances
are found in the synovial fluid: water, protein, glucose,
uric acid, creatinine, creatine, ammonia, urea, chlorides,
bicarbonates, potassium, sodium, calcium, magnesium,
phosphorus, sulphur, iodine, chlorine, iodine, bromine,
nitrogen, carbon dioxide, etc. The results of the histological
examination of the synovial tissue are also given.

4762, CONVERSION RATIO FOR RADIOACTIVE IODINE IN CARDIAC THYROTOXICOSIS - Konversní faktory radioaktivního jodu u kardiálních thyrotoxis - Vohnout S., Röhling S. and Silink K. Vyžkumný Úst. Endokrinol., Praha - ČAS. LÉK. ČES. 1958, 97/28 (902-909) Tables I Illus. 18
In 58 individuals with abnormal thyroid function a classification of thyroid dysfunction into 5 groups according to intensity was made on the basis of detailed clinical investigation and long-term follow-up (classification: hypofunction, eu-function, mild thyrotoxicosis, moderate and severe thyrotoxicosis) and the relationship of the conversion ratio for I^{131} to the degree of functional abnormality was tested. It was demonstrated that a high conversion ratio at 24 hr. (over 60%) occurs only in moderate and severe thyrotoxicosis regardless of whether this state was symptomatically slight or marked. A low conversion ratio (less than 60%) was found not only in cases of slight thyrotoxicosis, euthyroids and hypothyroids, but also in several cases of moderate and severe thyrotoxicosis. This method, therefore, cannot be used to differentiate the clinical grade of thyropathy, but is a very valuable aid in the differential diagnosis of cardiac dysfunction.

The biochemistry of iodine. III. Colorimetric estimation of iodine in salt. S. Vohnout and H. Brabencová (Ústřední endokrinol. ústav, Plzeň; Časopis Lékařů Českých 59, 55-6 (1950).—The method is based on the photometric estn. of the catalytic effect of I on the reduction of Ce^{4+} by H_4AsO_4 . Place into a 100-ml. volumetric flask 10 ± 0.001 g. of edible salt, rinse with about 90 ml. of H_2O , mix well, and after 2 hrs. dil. to 100 ml. Transfer 2.5 ml. of clear soln. to a 2nd 100-ml. volumetric flask and dil. with H_2O to 100 ml. Transfer 3 ml. of this soln. to a test tube, add 0.5 ml. of the reducing soln. (4 g. As_2O_3 in 25 ml. 10% NaOH, 200 ml. H_2O , 100 ml. H_2SO_4 and dild. to 500 ml.), place in a water bath at 25° . After preheating 15 min. add 0.5 ml. of a soln. of Ce^{4+} (12 g. $(\text{NH}_4)_2\text{Ce}(\text{SO}_4)_2 \cdot 2\text{H}_2\text{O}$ in 10% H_2SO_4) and heat for exactly 20 min. Read in photometer with a blue filter and det. the concn. from a calibration curve. The method has an error of $\pm 5\%$. IV. Iodine deficiency in Czech. inhabitants. Stanislav Vohnout and Otomar Pihar. Ibid. 579-583.—The results of analyses of I in urine of human subjects from 29 communities from the district of Liberec, Ústí, Pilsen, Prague, and Carlsbad have shown a daily deficiency between 30-80 γ of I, assuming the daily essential min. is 100 γ . V. Colorimetric estimation of urinary iodine. S. Vohnout and H. Brabencová. Ibid. 743-5.—The micromethod consists of quant. isolation of trace amts. of I from org. material, mineralized with $\text{K}_2\text{Cr}_2\text{O}_7\text{-H}_2\text{SO}_4$ by the means of distn. in the Riggs app. (cf. C.A. 38, 4035^a) and by the photometric detn. (see above). The method can be used for samples contg. 10^{-4} g. I and has an error of $\pm 8\%$. VI. Estimation of iodine in drinkable and surface waters. Ibid. 1205-6.—By the application of the above described method a quant. detn. of 0.01-0.1 γ I is made possible and permits the use of a sample of only 100 ml. A. Ženíšek

Polarographic detection of iodine in urine Casopis Lekaru Ceskych 1943,
87/45 (1182-1185) Tables 5 Illus. 2

After evaporation of the urine sample it is oxidized by potassium bichromate
in the presence of conc. sulphuric acid. Iodate is freed by reduction with
arsenite in Parnass's distilling apparatus, oxidized by means of chlorine or
bromine water and, after concentration to a small volume, is determined
polarographically. The error is \pm 10% with 50 ml. of urine containing
0.5-5 ug of iodine.
